

# AN UPPER CARDINAL BOUND ON ABSOLUTE E-RINGS

DANIEL HERDEN

Let  $\kappa(\omega)$  denote the first  $\omega$ -Erds cardinal. In this short talk we will give proof that for every abelian group  $A$  of cardinality  $\geq \kappa(\omega)$  there exists a generic extension of the universe, where  $A$  is countable with  $2^{\aleph_0}$  injective endomorphisms.
